

#29 Require and Require Relative

Where to use?

main program

Require : Used to load another ruby files in the main ruby program.

"require" Syntax

- In order to use the `require` statement we have to load the path of the ^{other ruby} file which we want to incorporate in our main program, `$LOAD_PATH << '.'` The dot signifies —
↳ double leftshift operator

we have to look for the file in the same directory in which our project is stored.
So the dot is actually the path of our project. (or signifies same directory.)
(or the files in same directory)

`$LOAD_PATH << '.'` → path of file
(in same directory).
(require "filename")
→ if you don't want to write this.

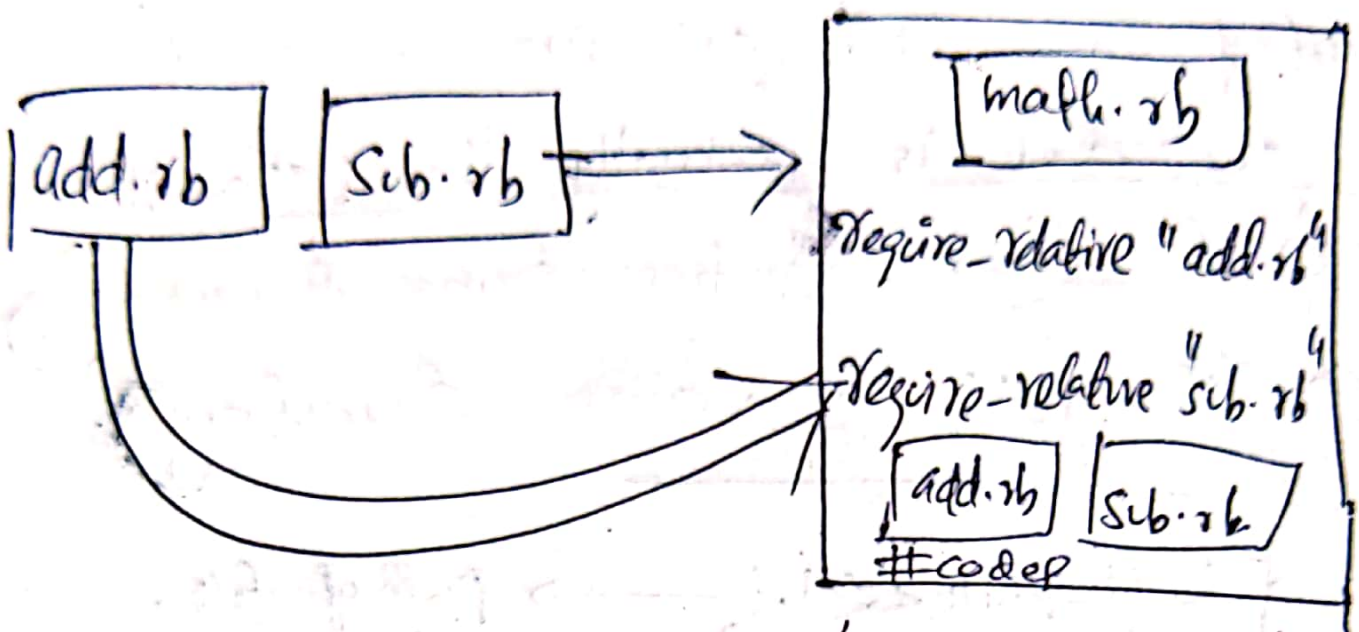

Require-relative "filename"

Avoid absolute path such as
/home/user/docs/add.rb

⇒ require-relative "rubyfile"

require-relative works only for same directory.
if there is a main program in a folder (project)
and a ruby file in the same folder.

If we want to require the ruby file in the main program, use require-relative "rubyfile" in the main program.

⇒ no need to specify the `$LOAD_PATH` here
Bcz `require_relative` itself specifies
the path of the directory where the
`math.rb` is stored or where the
`add.rb` and `sub.rb` is stored.
